

What is Chiropractic?

Chiropractic is the third largest primary health care profession in the world after medicine and dentistry.

Who regulates the profession?

In the UK, Chiropractic is a fast-growing, independent profession regulated by the General Chiropractic Council.

How does it work?

Chiropractic places its emphasis on the diagnosis and management of problems affecting the nerves, muscles and joints of the body.

What can Chiropractors do?

Chiropractic is a profession, not a treatment. Chiropractors provide a package of care after taking a detailed case history and performing a thorough examination, which considers all aspects of the presenting complaint. This package of care may include physical treatments drawn from all types of manual therapy as well as spinal manipulation, exercise, muscular therapies and a range of advice on activity, lifestyle and prevention. The most compelling evidence for

chiropractic care relates to low back pain, but chiropractors help people manage a range of other conditions. This does not necessarily mean that joint manipulation is used, but that the package of care given by the chiropractor provides relief.

How can I find out more?

For more information on Chiropractic and to find out how your Chiropractor can help you, please call the telephone number below.

What is a 'slipped disc'?

The familiar term 'slipped disc' is a misnomer. The discs between the vertebrae of the spine are firmly attached and cannot actually slip out of place. However, they can wear, split and herniate (bulge out).

A normal, healthy disc is very strong but over time, as it undergoes wear and tear from repeated bending, twisting, lifting and prolonged sitting, the outer ring of disc fibres (the annulus) can weaken allowing 'leakage' of the softer, inner tissue out of the centre of the disc. This is a disc herniation, which may result in an inflammatory reaction and put pressure on the adjacent spinal nerve resulting in leg pain (sciatica) as well as back pain.

Is it a common problem?

The term 'slipped disc' is used quite frequently as a diagnosis for back pain but, contrary to popular belief, symptomatic disc herniations are not that common and 'sciatica' is often due

Focus on conditions

Chiropractic – Safe & Effective

to referred pain from the muscles, joints and ligaments of the spine.

Disc herniation can be a serious injury possibly requiring surgery although, fortunately, only in a small number of persistent cases. Urgent surgery may be indicated if your bowel and bladder control is affected; these may be symptoms of a rare but serious condition called *cauda equina* syndrome.

If you develop back pain with leg pain/weakness and also experience any changes in your bowel or bladder control, or numbness in the 'saddle' area, you should seek medical advice from your local A&E department without delay.

What can I do to prevent disc injuries?

There are different degrees of injury ranging from mild tears on the outside of the disc to more severe protrusions.

The risk of developing a disc herniation increases every time you bend forward, especially if you are holding a load and you twist or sit whilst doing it.

The following points will help to **reduce the pressure on your discs**.

- Avoiding prolonged sitting, bending, twisting and carrying
- Using a support belt to keep your back straight when you do manual work
- Avoiding prolonged driving

Some of the **risk factors for developing a disc injury** are:

- Episodes of back pain in the past
- Poor physical fitness and poor core stability
- Heavy manual work involving bending and lifting
- Prolonged sitting and vibration i.e. driving
- Smoking

If your back and stomach muscles are strong, you bend correctly and you sit correctly, your spinal structures, including the discs, are protected. While regular exercise is important, exercises involving repeated bending and twisting, especially while sitting, should be undertaken in moderation. Sit-ups and twisting stretches of the back are not as good as you might think!

Your Chiropractor has the necessary skills to diagnose a herniated disc and to advise on treatment. There are a number of treatment options depending on the severity of the condition and these include chiropractic manipulation (Santilli et al, 2006) and associated physical therapy. Part 2 of this information leaflet provides more information about sciatica and the treatment of disc injuries.

If you have any questions about disc injury and sciatica, please speak to your Chiropractor on [0845 450 6447](tel:08454506447) for further advice

Common Conditions that can benefit from Chiropractic Care

It is a common misconception that Chiropractors only treat back and neck conditions. Here are some conditions that Chiropractors routinely encounter and treat, and evidence that shows the care that Chiropractors provide is effective (http://www.gcc-uk.org/page.cfm?page_id=1550):

- Cervicogenic dizziness
- Cervicogenic headache
- Frozen shoulder (adhesive capsulitis)
- Hip osteoarthritis
- Knee osteoarthritis
- Migraine headache
- Patellofemoral pain syndrome
- Plantar fasciitis
- Sciatica / radiating leg pain
- Shoulder girdle pain / dysfunction
- Tennis elbow
